

Abstract of the Disclosure

A sliding-type mobile communication terminal has a camera module interlocking with a sliding motion. The sliding-type mobile communication includes a main body having a main printed circuit board and the camera module, a sliding body slidably mounted on the main body, a camera module installed in the main body, front and back openings through which the camera module can be exposed to an external side, the front and back openings being formed in front and back of the main body, respectively, and interlocking means for synchronizing the camera module with a sliding motion of the sliding body on the main body.
